WARRANTY POLICY

Buhler Manufacturing products are warranted for a period of twelve (12) months (90 days for commercial application) from original date of purchase, by original purchaser, to be free from defects in material and workmanship under correct, normal agricultural use and proper applications.

Buhler Manufacturing’s obligations under this warranty shall be limited to the repair or exchange, at Buhler Manufacturing’s option, of any Buhler Manufacturing product or part which proves to be defective as provided. Buhler Manufacturing reserves the right to either inspect the product at the buyer’s location or have it returned to the factory for inspection.

The above warranty does not extend to goods damaged or subject to accident, abuse or misuse after shipment from Buhler Manufacturing’s factory, nor to goods altered or repaired by anyone other than an authorized Buhler Manufacturing representative.

Buhler Manufacturing makes no Express Warranties other than those, which are specifically described. Any description of goods, including any references and specifications in catalogues, circulars and other written material published, is for the sole purpose of identifying goods and shall conform to such descriptions. Any sample or model is for illustrative purposes only and does not create an Express Warranty that the goods conform to sample or model shown.

The purchaser is solely responsible for determining suitability of goods sold. This warranty is expressly in lieu of all other warranties expressed or implied. Buhler Manufacturing will in no event be liable for any incidental or consequential damages whatsoever. Nor for any sum in excess of the price received for the goods for which liability is claimed.

WARRANTY CLAIMS:
Warranty requests must be prepared on Buhler Manufacturing Warranty Claim Forms with all requested information properly completed. Warranty Claims must be submitted within a thirty (30) day period from date of failure repair.

WARRANTY LABOR:
Any labor subject to warranty **must** be authorized by Buhler Manufacturing. The labor rate for replacing defective parts, where applicable, will be credited at 100% of the dealer’s posted shop rate. Defective parts will receive an extra 10% discount to assist with freight or other incidental costs.

GOVERNMENT LEGISLATION:
Warranty terms and conditions are subject to Provincial or State legislation.

IMPORTANT FACTS:
Buckets and Bucket Tines Carry No Warranty
Bent Spears Carry No Warranty
Snowblower Fan Shafts Carry No Warranty
Mower Blades Carry No Warranty
Portable Auger Parts Have Two (2) Year Warranty
Loader Parts Have Two (2) Year Warranty

IMPORTANT NOTE:
This warranty does not apply to rentals.

INTRODUCTION

Buhler Farm King gives you more choices to match your auger to your bins, power sources and operating convenience. The superior scissor lift system features a one way hydraulic cylinder with a restrictor valve to control the rate of descent in the event of hydraulic hose failure. This feature is safer than conventional cable systems. Also, note the extra wide undercarriage and wheel tread providing better stability at greater heights, particularly in windy conditions. This unique mechanical linkage is designed to use less hydraulic pressure to lift the auger, even when fully loaded.
The pivoting Hopper Lift arm may be flipped over for left or right transport position. Slip the PTO from the main shaft onto the optional reverse kit for complete cleanout. An adjustable arm holds the PTO shaft when not in use. The hitch is adjustable for various tractor hitch lengths.

The shut off valve is designed to keep your auger in the position you set it.
The cross auger and main auger are driven by two internal gearboxes, easily reached for service. Because of the large input and intake boxes, capacity is not restricted.
The standard self leveling hopper on all Back Saver augers stays flat on the ground, even when the auger is raised up to a high bin. The optional double auger hopper is 2.5" lower than the standard self-leveling hopper. An optional 2 wheel power mover allows you to move the hopper back and forth with finger tip control.
Other advanced features include a tapered thrust bearing at the top of the auger, torqued to remove pressure on the bottom end bearing.

Keep this manual handy for frequent reference. All new operators or owners must review the manual before using the equipment and at least annually thereafter. Contact your Buhler Dealer if you need assistance, information, or additional copies of the manual. Visit our website at www.buhler.com for a complete list of dealers in your area. The directions left, right, front and rear, as mentioned throughout this manual, are as seen facing in the direction of travel of the implement.

SAFETY

Remember, YOU are the key to safety. Good safety practices not only protect you, but also the people around you. Make these practices a working part of your safety program. Be certain that everyone operating this equipment is familiar with the recommended operating and maintenance procedures and follows all the safety precautions. Most accidents can be prevented. Do not risk injury or death by ignoring good safety practices.

The alert symbol is used throughout this manual. It indicates attention is required and identifies hazards. Follow the recommended precautions.

The safety alert symbol means…

ATTENTION! BECOME ALERT! YOUR SAFETY IS INVOLVED!

CAUTION

The caution symbol indicates a potentially hazardous situation that, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

WARNING

The Warning Symbol indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury, and includes hazards that are exposed when guards are removed. It may also be used to alert against unsafe practices.

DANGER

The Danger Symbol indicates an imminently hazardous situation that, if not avoided will result in death or serious injury. This signal word is to be limited to the most extreme situations, typically for machine components that, for functional purposes, cannot be guarded.

GENERAL SAFETY INSTRUCTIONS

Have a first-aid kit available for use and know how to use it.
Have a fire extinguisher available, stored in a highly visible location, and know how to use it.
Wear appropriate protective gear. This list may include but is not limited to:

- Hard hat
- Protective shoes with slip resistant soles
- Protective glasses or goggles
- Heavy gloves
- Wet weather gear
- Hearing protection
- Respirator or filter mask

Read and understand the Operator’s Manual and all safety signs before operating, servicing, adjusting, repairing, or unplugging the equipment.
Do not attempt any unauthorized modifications to your Buhler product as this could affect function or safety, and could affect the life of the equipment.
Inspect and clean the working area before operating.
Keep hands, feet, clothing, and hair away from moving parts.
Ensure bystanders are clear of the area before operating.

START-UP SAFETY

Do not let inexperienced operators or children run this equipment.
Place all tractor and machine controls in neutral before starting.
Operate only with ROPS and seatbelt equipped tractors.
Do not operate inside a building unless there is adequate ventilation.
Ensure all shields are in place and in good condition before operating.
Stay clear of PTO shaft and machine when engaging PTO.
The auger must be on a level surface and wheels free to move when raising or lowering. Everyone should be kept clear during these operations.

OPERATION SAFETY

Do not permit riders.
Do not wear loose fitting clothing during operation.
Empty the auger before moving, to prevent upending.
The Backsaver Auger should be attached to the drawbar of the tractor at all times during operations.
Do not allow anyone other than the operator close to the Auger when in operation.
Never stand under the auger while raising or lowering.
When filling tall bins, tanks, or granaries, it is advisable to anchor the auger to the bin or building to prevent it from being tipped over by the wind or a sudden movement. The upper end of the auger should rest on some support when in operation.
Do not operate Intake Auger when it is folded in transport position.
Never raise the intake end of the auger above waist high, as the balance shifts forward, and the auger will tip over.
Stay away from overhead obstructions and power lines during operation and transporting. Electrocution can occur without direct contact.

TRANSPORT SAFETY

Review Transport Safety instructions in tractor manual before moving.
Check with local authorities regarding transport on public roads. Obey all applicable laws and regulations.
Do not tow equipment that does not have brakes at speeds over 32km/h (20 mile/h).
Do not tow equipment that does not have brakes that, when fully loaded, has a mass (weight) over 1.5 t (3300 lb) and more than 1.5 times the mass (weight) of the towing unit.
Make sure the SMV (Slow Moving Vehicle) emblem and all the lights and reflectors that are required by the local highway and transport authorities are in place, are clean, and can be seen clearly by all overtaking and oncoming traffic.
Never have the equipment in operation during transport.
Always transport the Backsaver Auger in the down position, carrying the weight of the auger on the undercarriage itself, and not the hydraulic cylinder.
Take extreme caution in maneuvering on or around tight corners so as not to catch the end of the auger on trees, buildings, power lines, etc.
The equipment should never be towed without the safety chain securely attached to the auger and the towing vehicle.
When moving the auger on the road, always use a red flag, or if absolutely necessary to move at night, accessory lights for adequate warning to operators of other vehicles.
Always travel at a safe speed.
Inflate transport tires to recommended pressure.

SERVICE AND MAINTENANCE SAFETY

Stop engine, set brake, remove ignition key, and wait for all moving parts to stop before servicing, adjusting, repairing, or unplugging.
Support the equipment with blocks or safety stands before working beneath it.
Follow good shop practices including
- Keep service area clean and dry
- Be sure electrical outlets and tools are properly grounded
- Use adequate light for the job

Use only tools, jacks, and hoists of sufficient capacity for the job.
Replace and secure all shields removed during servicing before operating.
Use heavy leather gloves to handle sharp objects.
Check hydraulics regularly for leaks. Use cardboard to look for leaks, and use hand and eye protection.
Relieve pressure on hydraulic system before repairing or adjusting.
Failure to follow proper procedures when mounting a tire on a wheel or rim can produce an explosion, which may result in serious injury or death.

STORAGE SAFETY

Store the unit in an area away from human activity.
Do not permit children to play on or around the stored machine.
Support the frame on stands and blocks to provide a secure base.
When storing an auger, park it on level ground so that the bottom end will never be over its center of gravity.
Block the wheels of the auger so that the auger will not move and tear the jack from it’s mount.

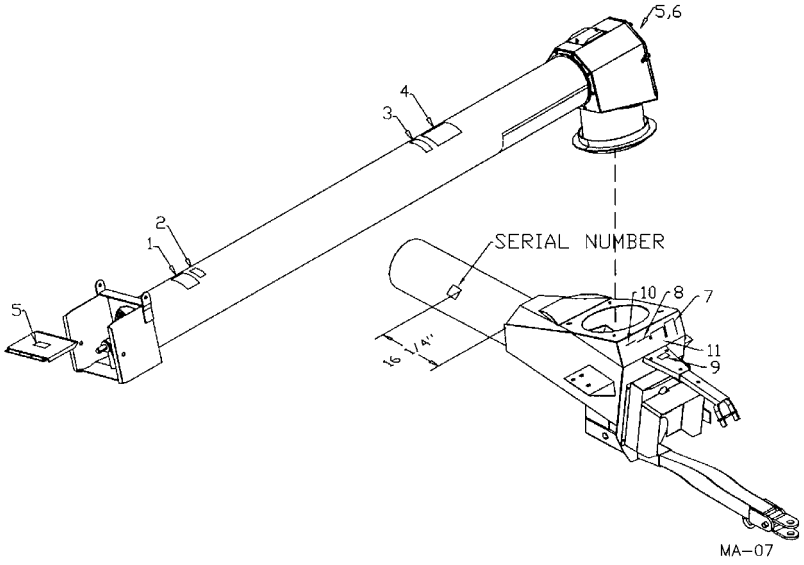
SAFETY SIGNS

The following illustration shows the approximate location and detail of safety signs.
Keep all safety signs clean and legible and replace any that are damaged or missing.
When original parts are replaced, any safety signs affixed to those parts should be replaced as well. Replacement safety signs are available from your local dealer.

INSTALLATION

To install safety signs, ensure the installation area is clean and dry. Decide on the exact position before you remove the backing paper. Remove the smallest portion of the split backing paper and align over the specified area. Carefully press in place. Slowly peel back the remaining paper and smooth the remaining portion in place. Small air pockets can be pierced with a pin and smoothed out.

13” AUGER SAFETY SIGNS



Replace safety signs immediately should they become damaged, torn or illegible. Obtain replacements from your authorized dealer using the part numbers shown.

ASSEMBLY INSTRUCTIONS

1. Assemble the top section (#3) to the center section (#2) making sure the flighting is aligned and locked with a ½” x 2 ¾” (gr. 8) hex bolt and lock nut. Similarly, assemble the bottom section (#1) to the center section using 7/16” x 1 ¼” hex bolts, lock washers and hex nuts to fasten the auger rings together. Fasten the input box (#121) to the bottom tube using 7/16” x 1 ¼” hex bolts, lock washers and hex nuts.

   ⚠ **ALERT:** There are two holes on the top stub shaft for cotter pin installation on the top flighting, which should allow a wide range of adjustment. If the top flighting is too high, there could be a shortage of room to mount the collar on the bottom bearing in the input box.

2. Bolt bearing flanges (#209) and mount bearing (#185) at the bottom (outside) of input box using ½” x 1 ¼” hex bolts, lock washers and hex nuts. Loosen cap at the top end of auger. The hex bolts should be turned so the hex nuts are on the inside of the input box. If this is not done, the tips of the hex bolts may rub on the chain in the input box. After locking the bottom bearing with the collar, tension the flighting by turning the 1 ¼” hex nut at the top of the auger and replace top cap.

   Loosen the chain idler assembly on the input box and mount the 15T sprocket (#137) on the flighting bottom stub shaft. Assemble the chain (#138) and then slide the idler assembly into place and tighten. Attach the PTO shaft. The tractor end has a standard 6-spline end with a spring-loaded locking collar. The auger end has a clamp-style yoke with a 3/8” keyway. Slide the yoke onto the flighting stub shaft with a 3/8” key supplied. Lock the yoke in place with two ½” x 3” bolts and lock nuts fitted through the groove in the flighting stub shaft. After tightening the bolt, insert and tighten the 3/8” socket set screw. Bolt the chain guard (#124) back to the bottom of the input box.

3. The main bridging yokes (#7) are clamped to the welded plate near the top of the bottom section tube using two clamps (#189). The yokes fit between the welded stops on the clamps. Bolt on the clamps using 5/8" x 1 ¾” hex bolts, lock washers, flat washers and hex nuts.

   ⚠ **ALERT:** The 13” x 85’ auger has two positions to bolt on the main bridging yoke. The 85’ auger uses the lower position. The upper position is only used when adding a 10-foot extension to make a 95’ auger. Refer to the drawing included in this manual.

ASSEMBLY INSTRUCTIONS - CONT'D.

The yoke mount (#27) is bolted to the bottom end of the main yokes with the same size bolts. Attach the two braces (#8) to the main yokes using 7/16" x 1 ¼” hex bolts, lock washers and hex nuts. The smaller bridging yokes (#9) are bolted to the bottom and center sections with the same 5/8" bolts. Attach the tie rods (#10) to the bridging yokes using 7/16" x 1 ¼” hex bolts, lock washers and hex nuts. The 85' auger has two sizes of bridging yokes (#9). The 68 ½” long yoke is on the bottom section while the 78 ½” yoke is on the upper part of the center section. The 31 ½” tie rod fits on the lower yoke and the 34” tie rod fits on the upper yoke.

4. Mount both sets of cables (#62) and (#63). The longer cable goes from just above the input box, across all three bridging yokes, to about the center of the top section. The shorter cable goes from just behind the undercarriage pivot ring, across the main bridging yoke, down to the center tube just below the bridging yoke. Bolt the cable yokes (#13) to the top of each cable using ½” x 2" hex bolts, lock washers and hex nuts. Bolt the yokes to the cable brackets welded to the top tube with the same hardware. Use the bottom hole in the yoke if possible. The other holes can be used if the cable stretches after a few years. Be sure to tighten cables before lifting the auger. The main tubes must be straight or bowed up a few inches before lifting the auger. Any downward bow will result in very loud flighting noise. Tighten cable clamps (#16) on bridging yokes after cables are tight.

⚠ **ALERT:** On bridging yokes where the cable clamps hold two cables, DO NOT use the cast part of the cable clamp or it will be very difficult to get the nuts on the clamp. Use 3/8" I.D. (1O ga) flat washers on cable clamps.

5. Lift the auger at a point just above the main bridging yoke. After raising the top end of the auger, clamp on spout (#11) using 3/8” x 2” hex bolts, lock washers and hex nuts.

6. Mount the L.H. undercarriage arm (#85) only to the pivot ring on the bottom section.

⚠ **ALERT:** The 13” x 85’ auger has two pivot rings. The 85’ auger uses the lower position. The upper position is only used when adding a 10-foot extension to make a 95’ auger. Refer to the drawing included in this manual.

7. Mount wheels (#94) and tires on axle using ½” wheel bolts for the 70’ auger and 9/16” wheel bolts for the 85’ auger. Torque bolts to 80 ft/lbs for ½” bolt and 140 ft/lbs for 9/16” bolt.

8. Bolt the arm to the axle (#83) using 5/8" x 2" hex bolts, lock washers and hex nuts. Do not mount the R.H. undercarriage arm (#84) until after assembling the lift arms. The reason for this is so you can get at the lift arms with a forklift (if available) to lift them into position.

ASSEMBLY INSTRUCTIONS - CONT'D.

9. **70' AUGERS:** Connect the L.H. lower lift arm (#65) to the axle with a 1” x 5 5/8” pin (#79) and ¼” x 1 ½” cotter pin. Assemble the yoke (#66), the link (#67) and the hydraulic cylinder (#68) using a 1 ½” x 12 3/8” pin (#75).

⚠ **ALERT:** Cylinder ports face DOWN.

Lift this assembly under the auger between the lift arm locations. Connect the R.H. lower lift arm (#64) to the axle. The 2" x 27 7/8" pin (#74) connects this assembly to the lower lift arms. Bolt the torque tube weldment (#208) to the flanges on the lift arms using ½” x 2” bolts, lock washers and hex nuts. Fasten the upper lift arm cradle (#81) to the welded brackets on the torque tube. Use 5/8” x 1 ¾” hex bolts, lock washers and hex nuts. The cradle must be turned offset to the bottom end as shown in drawing.

⚠ **ALERT:** Do not tighten any hardware assembled during this step.

85' AUGERS: Same assembly procedure as the 70’ except the 1” pins are 6 3/8" long; the pin joining the link, yoke and cylinder is 2" x 14 ¾” and the lower lift pin is 2" x 34 1/8".

10. **70' AUGERS:** Connect the upper lift arm (#180) to the lower lift arms using two 1 ½” x 7” pins (#77). In order to allow correct movement of the upper and lower lifts, this pin is to be installed from the inside out; with the head of the pin end facing the center of the auger and the cotter pin end facing out. Use washers on the outside of the pin if required to snug up the head of the pin on the inside of the lift arms. The 1 ½” x 13 5/8” upper yoke pin (#78) connects the yoke (#66) to the upper lift arm.

85' AUGERS: Same assembly procedure as the 70' except the pins joining the upper and lower lift arms (#77) are 2" x 9 1/8" and the upper yoke pin (#78) is 1 ½” x 16 5/8".

11. When the lift arms are assembled, bolt on the R.H. undercarriage arm (#84) and join the two arms with a tie plate (#86) using 7/16" x 1 ½” hex bolts, lock washers and hex nuts.

12. Bolt the lift arm cradle (#82) to the angle irons on the undercarriage using 5/8" x 1 ¾” hex bolts, lock washers and hex nuts. The 2" square tube bolts to the bottom of the angle irons on the 70' auger and to the top of the angle irons on the 85' auger. Ensure that the hooks on the lower lift arms rest on top of the lift arm cradle after assembly.

A 1 ½” x 15 ¼” pin (#80) joins the upper lift arm to the bottom section of the main tubing on both the 70’ and 85’ auger. A forklift is probably the best way to lift the arms as required to line up the bushings so the pins can be inserted.

ASSEMBLY INSTRUCTIONS - CONT'D.

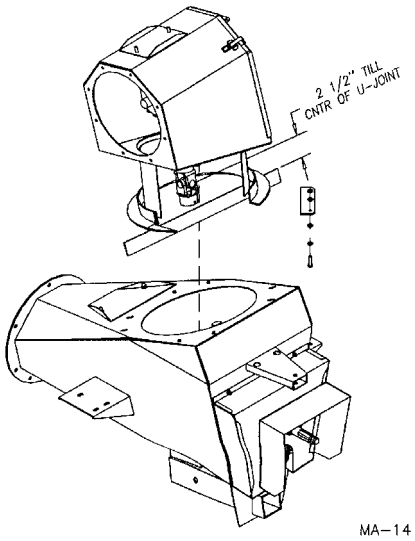
13. Mount the hydraulic cylinder (#68) to the upper lift arm using a 1 ½” x 8 5/8" cylinder pin (#76). Be sure the ports face down. Connect the six foot hydraulic hose (#72) with attached flow control (#71) and fittings from the base end of the cylinder to the hydraulic line on the main auger. For 85' auger the cylinder pin (#76) is 2" x 9".

⚠ **ALERT:** This pin is made of ground and polished high strength steel. Make sure you are not using one of the 2" x 9 1/8" lift arms pins (#77), which are only made of standard carbon steel.

⚠ **ALERT:** The flow control valve regulates the lowering of the auger to avoid damage which could be caused by lowering the auger too quickly. Arrow should be pointing away from the cylinder. Be sure that the valve is open approximately 3 ½ turns before raising to full position or auger will not lower.

14. Lift the auger up by the tubing so it raises out of the upper lift cradle about one foot. Center the upper lift on the cradle. Tighten all hardware while the auger is raised. Lower down into cradle after tightening hardware.

15. Using 3/8” sq. hd. set screws (#159) mount the u-joint (#123) on the intake auger gearbox. Position the u-joint by placing a straight edge along the bottom of the pipe ring on the intake auger top box (#112) and measuring exactly 2 ½” from the top of the straight edge to the center of the u-joint.



16. Lift the intake auger assembly onto the input box (#121). The splines on the u-joint must slide onto the splines on the input box gearbox shaft. This will probably require a hoist. Let the ring sit on the input box without forcing it to the exact center if it is not perfectly positioned. Remove one of the clean out covers from the input box and bolt on the ring using 3/8" x 1 ½” hex bolts. A 3/8" (10 gauge) flat washer (#51) goes under the input box top cover. The 1 ¼” o.d. flat washers (#174) should be 1/8” to 3/16” from touching the edge of the ring. This is done to prevent side pressure on the u-joint. Four 2” x 6 ½” plates (#130) act as a ring holder. Tighten using lock washers and hex nuts. The intake auger should turn freely around the input box.

⚠ **ALERT:** If the intake auger is removed for repair or replacement, the bolt coupling the flighting to the intake auger gearbox must be replaced when the flighting is replaced. Not replacing this bolt could cause failure of the hopper flighting.

ASSEMBLY INSTRUCTIONS - CONT'D.

17. Using a 5/16” x 1 ½” key (#184) join the hopper (#110) and the intake auger (#111) at the universal joint. Join the hopper and intake auger using two ¾” x 1 5/8” bolts and lock nuts. A flat washer goes on the outside only. Parts must swivel freely after bolting together. Check that the cross on the u-joint is in line with the two pivot pins. The cover (#192) bolts to the front edge of the hopper using ¼” x ¾” hex bolts, lock washers and hex nuts. The cover is held down by the cover rod (#193) which is pushed through the clevises welded to the intake auger and held in place by a washer and spring clip.
With the cover (#192) removed, tighten all set screws on the universal joint and be sure that it has grease.

⚠ **ALERT:** Never run the auger without this cover bolted on. **THE YOKE CENTER MUST ALIGN WITH PIVOT HOLES AFTER ASSEMBLY.**

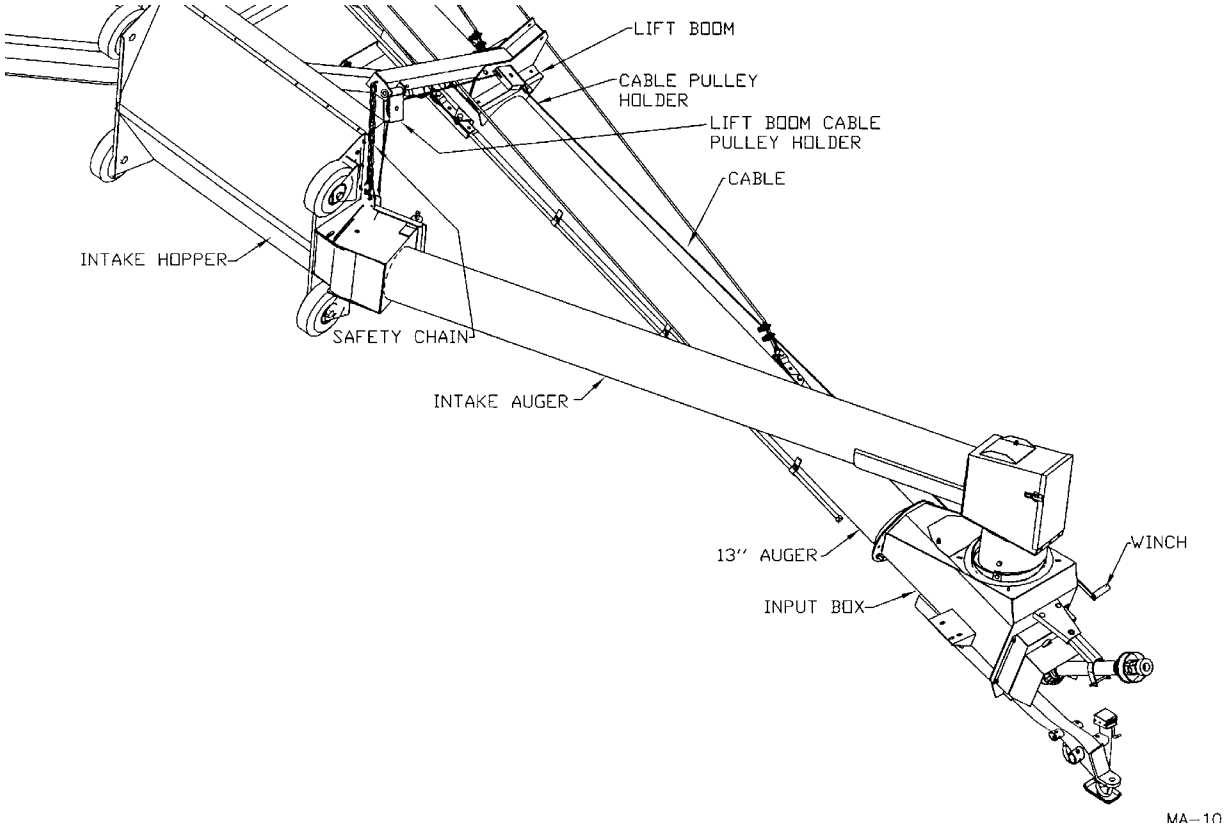
18. **Standard Hopper only:** Bolt the 6" wide rubber edging supplied to the top edge of the hopper on the inside using ¼” x 1” hex bolts, lock washers and hex nuts. The 1" wide strips supplied bolt to the rubber on the inside of the hopper and help keep the rubber from tearing. The ends of the rubber strips are joined using 2" x 3" plates with ¼” x 1” hex bolts, lock washers, flat washers and hex nuts.

Multi-flighting Hopper only: Bolt the rubber edging (#43) supplied to the top edge of the hopper on the inside using ¼” x 1” hex bolts, lock washers and hex nuts. One end of the rubber bolts to a welded bracket at the front of the hopper. The long 1” side strips (#39) bolt to the rubber on the inside of the hopper and help keep the rubber from tearing. Two 1” strips (#40) hold the rubber edging at both ends of the hopper. The ends of the two rubber strips are joined by two 3” x 3” connector plates (#42) at the top edge. All strips use the same hardware.

19. The lift boom (#29) is bolted to a bracket on top of the main tube about 127" from the bottom pipe ring using ½” x 1 ¼” hex bolts, lock washers and hex nuts. Thread the ¼” cable (#28) around the pulley at the end of the lift boom and then around a cable pulley in the bracket which swivels at the back of the lift boom. From there you go down to the winch. Clamp cable to winch before mounting. There are two flat iron hooks at the front edge of the hopper. Hook the lift cable in the hook furthest away from the auger so the hopper will turn open end toward the auger. The safety chain is attached to the welded loop at the bottom of the intake auger using the hook and quick link supplied. The boom can be used on either side of the auger but the winch must be moved to the opposite side. Fasten winch to the input box on the side opposite the lift boom using 3/8” x 1” hex bolts, lock washers and hex nuts (see page 18).

⚠ **ALERT:** When the intake auger is raised in transport position, the lift cable is hooked into the loop at the bottom of the intake auger. The open end of the hook **MUST BE TURNED TOWARD HOPPER.** The intake auger could detach and fall if the main auger is raised with the hook turned the other way. See diagram on next page.

ASSEMBLY INSTRUCTIONS - CONT'D.



20. Re-check and tighten all bolts.

21. Immediately after setting up the auger, hook it up to a tractor. Raise and lower the auger three or four times to purge all the air out of the hydraulic line to the lift cylinder. This will help to prevent the auger from settling when you have it in working position above a bin.

⚠ **ALERT:** Always check to see that both ends of the PTO shaft are securely attached every time the auger is used. This should always be done with the tractor engine shut off. When transporting the auger, disconnect the PTO shaft from the tractor. The PTO holder on top of the input box is used to hold the PTO during transport.

Do not run the auger with the intake auger in the transport position. Doing this will damage the u-joint between the intake auger and the input box.

OPERATING INSTRUCTIONS

All augers may be elevated up to 45 degrees; however, for the best operating efficiency 35° should not be exceeded. At angles over 35 degrees the capacity and life of the auger decreases. Use in some types of fertilizer may cause accelerated wear and corrosion as well as added stress on lift components due to additional load. Use in fertilizer can affect warranty.

Run auger partially full until flighting becomes polished.

Never operate an empty auger for over one minute as the flighting and housing will experience excessive wear.

To position the auger, always tow or move the auger in the down position to a point as close as possible to the bin or barn.

⚠ **ALERT:** Always keep the wheels level. Raise the auger to the desired height and back the auger into position. Do not support the auger on the bin. As the auger becomes full it carries a lot of weight and may cause damage to the underside of the auger or to the bin. The auger should be firmly attached to the drawbar of the tractor at all times during operation.

⚠ **ALERT:** Never place blocks under the wheels to increase the elevation of the auger.

Be sure the wheels are free to move and no one is standing close to the auger when raising or lowering. Never attempt to raise or lower the auger while it is in operation.

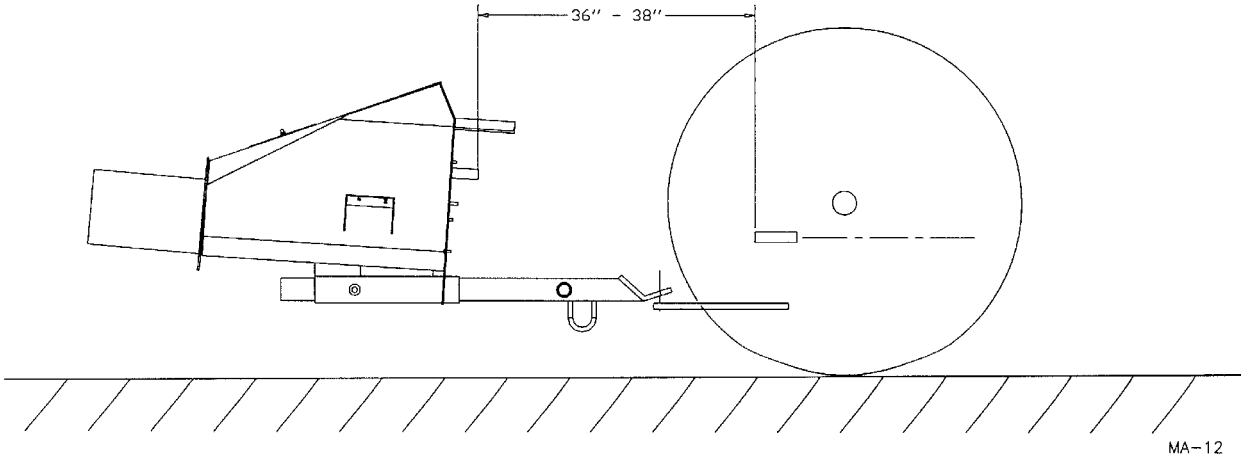
⚠ **ALERT:** Be sure winch brake is working properly before transporting. An arrow on the winch shows the proper direction of rotation. Improper rotation may cause winch failure. Never have less than three wraps of cable on the drum of the winch.

The intake auger swivels freely on the top of the input box. It can be positioned anywhere between the tractor and the side of the auger.

⚠ **ALERT:** 13" Augers are designed for PTO drive tractors with 540 rpm only. Maximum capacity will be attained while running the main auger between 450-500 rpm. (Do not use 1000 rpm PTO speed on these augers.)

OPERATING INSTRUCTIONS - CONT'D.

ALERT: Always maintain at least a 4” lap on the PTO shields. Be sure they turn freely and make certain everyone stands clear of the tractor, PTO shaft, and auger before engaging power take-off. Be sure ends are securely connected to the auger and tractor. An optional shaft is offered for extreme use.



The distance between the tractor and the auger stubs should be between 36” and 38” with the tractor and auger on level ground and the auger in full down position. This distance is obtained by either adjusting the tractor hitch, the auger hitch or both.

Before engaging power take-off, start tractor and idle engine. Engage power take-off slowly and bring PTO rpm up to recommended speed of 500 rpm for 13" augers.

Before stopping auger (except in an emergency) let all grain empty out of the auger, idle engine then disengage power take-off. Shut off tractor.

ALERT: Do not use the reverse kit to attempt to unplug the auger. The reverse kit is designed to be used for **CLEAN-OUT ONLY!**

ALERT: When auger is left in raised position over night, close the ball valve on the hydraulic line to the cylinder. This will prevent the auger from lowering, due to hydraulic leakage, and avoid possible damage.

OPERATING INSTRUCTIONS - CONT'D.

One way flow control valve (#71) can be adjusted by loosening the hex nut on the side, and turning on the screw with the machined end. Turning the screw in decreases the speed the auger lowers, while turning it out increases the speed. For the 13” x 70’ auger, the approximate initial setting should be three turns out from the tight position. For the 13” x 85’ auger, the approximate initial setting should be five turns out from the tight position. When set, re-tighten hex nut to set position. **NOTE**: Be sure that the valve is somewhat open before raising the first time or auger will not lower.

Be sure there is always some tension on the flighting by adjusting the end thrust bearing at the upper end of the auger.

ALERT: Always lower auger before transporting and allow the weight of the auger to rest on the undercarriage and not the hydraulic cylinder.

Be certain to turn jack sideways when towing auger.

ALERT: Disconnect the PTO shaft from the tractor and pin it in place in the PTO holder (#126) when towing or maneuvering the auger. This will prevent possible damage to the PTO shaft during cornering.

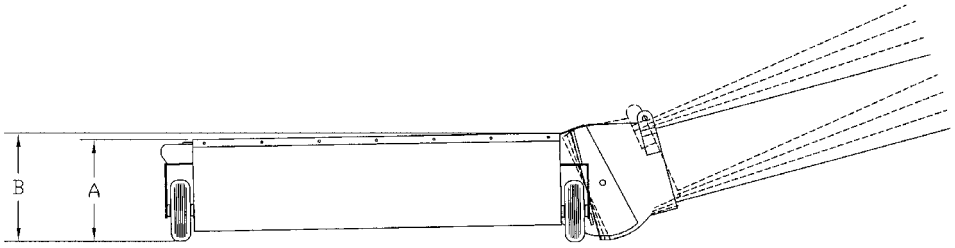
ALERT: If the PTO shaft angle exceeds 50 degrees during a tight turn, the constant velocity joints will be fractured and will likely fail shortly thereafter during operation.

PTO shear bolts (2 required) - 5/16" x 1" hex bolt (grade 8)

ALERT: When towing the auger, never exceed 32 kilometers per hour.

Always use a flag, or at night, a signal light when towing an auger on a road. Check your local regulations for further safety devices in this regard.

13" TOP FEED MECHANICAL DRIVE INTAKE AUGER PIVOT HOPPER

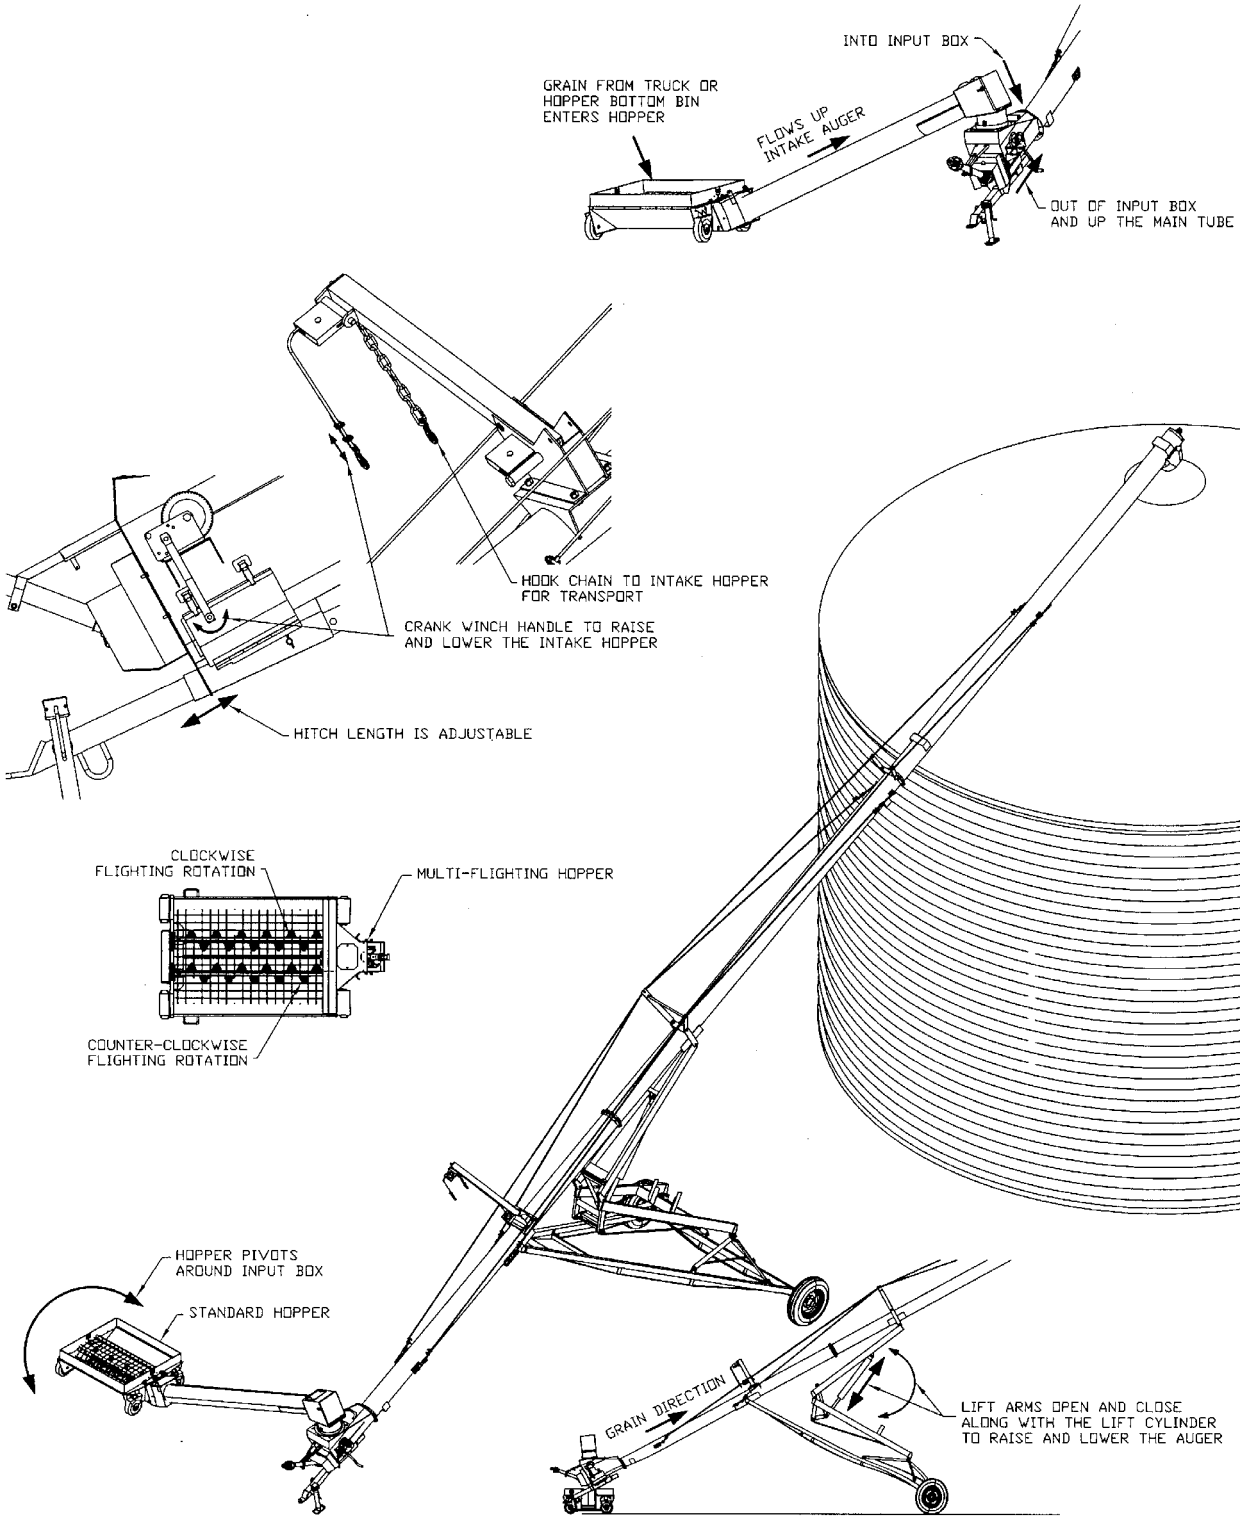


DIMENSION	10'' AUGER	13'' AUGER
A	13''	14 1/2''
B	14''	15 1/2''

MA-13

ALERT: All heights shown are for the welded hopper only. These heights remain the same at all auger working angles because of the pivot joint between the hopper and the intake auger.

THEORY OF OPERATION



ALL FLIGHTING ROTATES IN THE CLOCKWISE DIRECTION UNLESS OTHERWISE SHOWN

MAINTENANCE & LUBRICATION

Check condition of winch cable occasionally. Be sure it is lubricated.

Check to see that there is no downward bow in the main tubes at the start of every augering season. Re-tension cables if required as per step number four in the assembly instructions. This should also be checked immediately after hauling the auger for a long distance.

Use a high temperature grease for all lubrication.

Lubricate the PTO shaft as per instruction sheet.

Check grease on end thrust bearing to be sure it is running smoothly and freely. Remove cap and grease at the start of every season.

Check hydraulic lines frequently for leaks or damage.

Grease universal joint in intake auger after every eight hours of use.

Grease the U-joint connecting the two gearboxes about every 8 hours. Do regular checks on the oil level in the gearboxes. Fill if necessary to the height of the side plug using SAE 90 oil. Because the gearbox runs in the grain, it is difficult to see any oil leaks so regular checks should be done.

⚠ **ALERT:** When replacing bearings or tightening a loose bearing collar, always tighten collar in the direction of shaft rotation using a center punch or a similar tool.

Recommended tire pressure is 50 psi.

STORAGE

The auger should be stored in a dry place if possible. If stored outside, lower auger to its lowest position and block up the wheels so auger will not move.

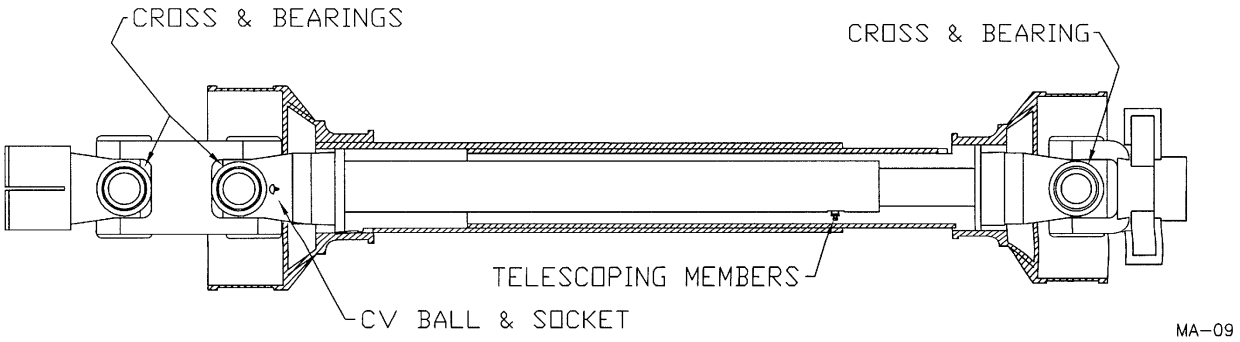
Clean auger thoroughly as dirt draws moisture and causes metal to rust. If the auger has been used to move fertilizer, clean thoroughly and apply oil or grease on entire flighting and inside the housing to stop and prevent further corrosion.

At this time check all moving parts for wear and order replacement parts from your nearest dealer.

When taking the auger out of storage, clean it thoroughly and check for obstructions at the inlet and outlet ends.

Check all bolts and set screws.

RECOMMENDED CUSTOMER GREASING PROCEDURE FOR 50 DEGREE C.V. PTO



A general purpose grease may be used. However, a grease containing 3% molybdenum disulfide will allow the lube intervals to be extended to twice as long as that listed. The first lube interval should be 16 – 24 hours of operation after initial start-up; then follow the schedule below. Constant angle applications must have a lube interval of 4 hours.

LUBE RECOMMENDATIONS

INTERVAL	LOCATION	AMOUNT
8 hrs.	Cross & Bearings	1 pump
8 hrs.	Telescoping Members	4-8 pumps (until grease comes out of end)
8 hrs.	CV Ball & Socket	1-2 pumps

Greases containing various percentages of moly. are available as extreme pressure greases. Please note that all E.P. greases do not contain moly so some investigation may be necessary. The following greases all contain 3% moly: Mobile Oil Company, “Mobile Grease CMP”; Shell Oil Company, “Retinax AM”; and Texaco, “Molytex EP (#0) and (#2)”.

Regularly check the tightness of all cable clamps to avoid slipping. Inspect wire rope regularly for evidence of wear or corrosion. Such inspections should take place at progressively shorter intervals over the useful life of the rope, as wear tends to accelerate with use and/or age. Where wear is rapid, the outside of a wire rope will show flattened surfaces in a short time. A piece of cloth or rag, rubbed along the wire rope will help to reveal broken wires. The effects of corrosion are not easy to detect because the exterior wires may appear to be only slightly rusty, and the damaging effects of corrosion may be confined to the hidden inner wires where it cannot be seen. To prevent damage by corrosion, the rope should be kept well lubricated. Periodic cleaning of wire rope by using a stiff brush and kerosene or with compressed air or live steam and relubricating will help to lengthen rope life and reduce abrasion and wear on sheaves and drums.

WHEN ORDERING PARTS

Always give your dealer the Model, Color and Serial Number of your machine to assist him in ordering and obtaining the correct parts. Use the exploded view and tabular listing of the area of interest to exactly identify the required part.

214	F0420	1/4" Safety Chain

13” x 10’ EXTENSION – ASSEMBLY INSTRUCTIONS

⚠ **ALERT:** This extension can be used to extend the 85’ auger to 95’ only. It is not made to be used on any other size of auger.

1. The 13” backsaver manual should be used for assembly instructions. The extension tube (#4) is mounted between the center and the top sections of the 85’ augers. Align all four sections before tightening the pipe ring bolts. Tube is turned as shown in drawing.

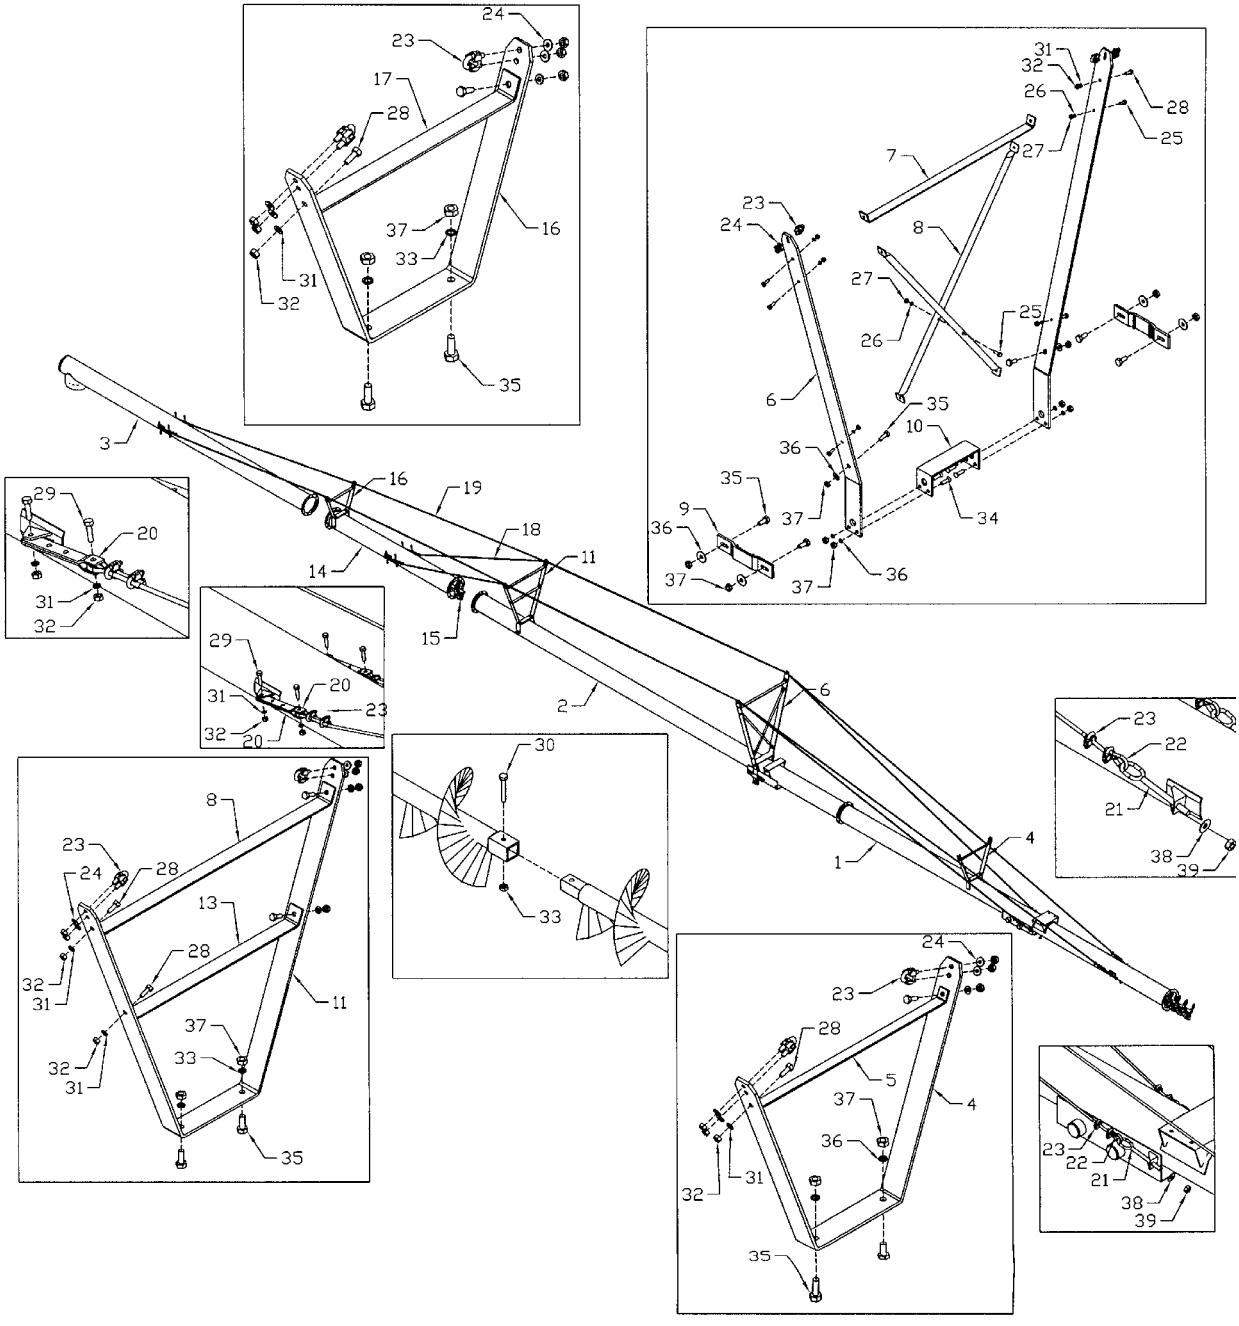
2. The cables must be removed and the main yoke (#5) must be re-positioned for a 95’ Auger. Use the higher of the two positions for the 95’ auger as shown on the illustration. The10’ extension has an additional bridging yoke (#33) and tie bar (#34).

3. The undercarriage pivot for 95’ auger must also be moved when converting from a 85’. The 95’ auger (on page 19) uses the higher of the two pivot rings. See the illustration with the instructions. The shift in the main yoke and undercarriage pivot ring is done to increase the weight at the bottom end for the 95’ auger. This should prevent loosing all the weight at the bottom end when emptying the auger.

4. The inner cables do not change from the 85’ to the 95’ auger. The outer cables mount as per the 85’ except they are attached to the extra bridging yoke on the 10’ extension.

5. The rest of the assembly is exactly the same as for a standard 85’ auger as described in the 13” backsaver manual.

13” x 95’ MECHANICAL AUGER BRIDGING & EXTENSION TUBE



13" x 95' BRIDGING & EXTENSION TUBE
